TARGET AUDIENCE
Medical and Nursing staff within the Intensive Care Unit

PURPOSE
This guideline has been developed for the care of the critically ill patient within the Intensive Care Unit.
This guideline is intended for use with ICU patients who can be enterally fed.

It aims to:
1. Prevent constipation / faecal impaction / bowel obstruction
2. Prevent large bowel overdistension and perforation risk
3. Promote regular bowel actions (at least once every two days)
4. Provide a feedback loop to reduce aperient overuse and resultant diarrhoea
5. Provide an easy to follow flowchart for use at the bedside

GUIDELINE
Delayed or non defecation (constipation) is common in Intensive Care, particularly in mechanically ventilated patients and those receiving narcotics. It is said to be present after no bowel motion for three days (72hrs). Potential sequelae include feeding intolerance, abdominal distension and perforation, bacterial overgrowth and translocation. Some papers report an association with increased length of stay, ventilator dependence and mortality.

There are many contributing factors: including the underlying pathology, multiple organ failure, fluid & electrolyte imbalance, sedation, the inability to strain, co-morbidities and medication, particularly opioids.

Treatment requires careful attention to all contributing factors, early enteral nutrition and the use of aperients. This flow chart has been developed to identify those most at risk of constipation with a view to early initiation of aperients.

There should be Daily Assessment of Bowel Motions with particular attention for any adverse features (Feed intolerance, Vomiting, Abdominal Distension). Follow the flow chart and alter the aperients as per the aperient ladder, increasing and decreasing according success or failure of defecation. If the Rectum is loaded with faeces, the Enema ladder is designed to ensure defecation within the next 24 hours.

If Guideline Failure is reached or there are any adverse features, consideration should be given to performing an Abdominal Xray (if clinically indicated) and/or Surgical referral.

Methylnaltrexone should be considered only in opioid induced constipation at Day 5 (discuss with unit pharmacist)
GUIDELINE

ICU BOWEL MANAGEMENT GUIDELINE

ICU Admission
(except listed exclusions on right)

Enteral Feeding?
Yes
High Constipation Risk?
Yes
No

No Aperients (position A on ladder)

Coloxyl & Senna ll BD (position B on ladder)

Daily Assessment of Bowel Motion(s)
Watch for Adverse Features: Feed Intolerance, Vomiting, Abdominal Distension

Maintenance

>72 hrs since bowels open?
No
Yes

Bowel Open?
No
Yes

Stool Consistency?

Soft

No Change

Hard

Fluid

Drop 2 steps on Aperient Ladder (No Aperients if at level A)

Climb 1 step on Aperient Ladder

Document Clinical exam & PR exam Daily

Rectum Empty

Rectal Exam Findings?

Climb one step on Aperient Ladder (exit at level F)

Rectum Loaded

Commence or Climb one step on Enema Ladder (exit at level 2)

Major Dysfunction

Guideline Failure

• If protocol failure or adverse features refer to Surgeons for further review
• Neostigmine only indicated for Acute Colonic Pseudo-obstruction (refer pseudo-obstruction guideline – in progress)
• Consider Abdominal X-ray

Management of Adverse Features

• Abnormal Examination?
• Consider Abdominal X-ray (Only if clinically indicated)
• refer to Surgeons

• Consider Methylprednisolone at Day 5 ENO if opioid induced constipation

Exclusions
Do Not Use for Patients with:
• Spinal Cord Damage
• Hepatic Encephalopathy
• Patients needing induced diaphoria (FMS)
• Post Bowel or Vascular Surgery (refer to Surgeon)

High Constipation Risk?
• Mechanical Ventilation > 24hrs
• Catecholamines > 5mcg/min
• Morphine > 50mg/day
• History of Constipation
• Multiple Organ Failure
